

# School of Electrical Engineering and Telecommunications

# **Tele9757 Quantum Communications Course Outline 2015**

Staff Contact: A/Prof Robert Malaney,

Email: r.malaney@unsw.edu.au

# **Course Aim**

The main aim of this course is to develop amongst students from different backgrounds a solid understanding of the key concepts and principles that underpin the emerging and exciting new world of quantum communications.

#### **Course Overview**

This course is for 6 Units of Credit and aimed at Graduate Engineers and Physicists wishing to understand the exciting new world of Quantum Communications. Quantum Communications and Quantum Networks are anticipated to be the core networking technologies of the 21st century. In fact these communication systems have already appeared in the commercial world in many variations. This course introduces the keys concepts important for understanding, testing, analyzing and improving the performance of quantum communication networks. It will have particular focus on actual quantum networks currently being deployed and the use of such networks for secure information transfer. Designed from an engineering perspective the course will first introduce the basic quantum physics that underlies quantum communication principles. It will then introduce and explore the key concepts that drive quantum communications such as Quantum Entanglement, Quantum Teleportation, The No Cloning Theorem, Quantum Cryptography; Privacy Amplification and Error Correction for Quantum Keys.

# Syllabus:

- 1. **[Week 1] Introductory Lecture**. Who wants to be a "Quantum Engineer"? Why study Quantum Communications and Quantum networks? What's wrong with classical networks? What Quantum physics will we cover in the course?
- 2. **[Week 1] Overview of Commercial Quantum Networks**. The future is now. What "real engineers" are now building. Overview of current Quantum networks both deployed commercially and those currently in prototype
- 3. **[Week 2] Photon Polarization.** Maxwell's equations revisited. Applications of polarization in Quantum Networks.
- 4. [Week 2 ]General Quantum Variables and Qubits. Applications of quantum variables in Quantum Networks
- 5. **[Week 3 ]Composite Quantum Systems**. Applications of quantum systems in Quantum Networks.
- 6. **[Week 4 ]Quantum Entanglement**. Why Einstein was wrong and right at same time. Why is entanglement important for Quantum Communications.
- 7. **[Week 4] Quantum Teleportation**. An application of composite qubits and entanglement
- 8. **[Week 5] Quantum Communications**. Superdense coding. Breaking the classical information barrier.
- 9. **[Week 6] Experimental Quantum Teleportation of Qubits**. Engineering sources of Entangled Photons. Why is this hard? What is state-of-the art. What does future predict?
- 10. [Week 6 ]The No Cloning Theorem. Copying classical information is easy, but try copying quantum information.
- 11. [Week 7] Review of Classical Cryptography. Algorithms and why classical encryption is defeated by Quantum Computers
- 12. **[Week 8] Quantum Cryptography**. The Bennett-Brassard Protocol for Quantum key distribution. Eckert's Protocol for Quantum key distribution using entanglement.
- 13. [Week 9] Review of Classical Error Correcting Codes. Hamming distance, Linear Codes, Generator Matrices, and all that jazz.
- 14. [Week 10] Error Corrections for Quantum Keys. Error correcting codes once quantum physics is thrown in
- 15. [Week 11] Privacy Amplification. Why error correction leaks information to a potential adversary and how to combat this with privacy amplification.
- 16. [Week 12] Summary, Review and Extending Your Knowledge. Review of course, suggestions for other work, and discussion of other related quantum courses and resources for research at UNSW. Guest Presentations.

# Text(s) and Reference(s):

**Main Text:** Protecting Information: From Classical Error Correction to Quantum Cryptography, S. Loepp & W. K. Wooters, Cambridge Press, 2006

**Secondary Text:** Quantum Computation and Quantum Information, M. Nielsen and I. L. Chuang, Cambridge Press, 2006.

Other Background papers may be added

# **Course Objectives & Learning Outcomes**

At the end of the course students should:

- understand the theory, concepts and challenges of quantum mechanics as applied to communications
- Understand the theory, concepts and challenges of transferring quantum information over a network
- c) Understand how applications actually operate over quantum a communication channel
- d) Understand why quantum communications is a vital new technology that will only grow in importance within the engineering world
- e) Understand and participate in discussions on the underlying principles of quantum networks
- f) Be able to design and simulate the behavior of quantum networks
- g) Be able to carry out calculations which determine the performance of a quantum network
- h) Be able to read and understand quantum communication research papers appearing in engineering journals

# **Teaching Methods & Strategies**

Lectures = 3*hrs/week* 

The lectures will introduce the core concept and principles of quantum communications. Following the lecture a discussion session on the core material will take place in order to solidify your understanding. Tutorials and model solutions will be presented at the end of each lecture in order to re-enforce your ability to design quantum networks and to carry out detailed calculations relating to communication performance.

#### **Relation to other Courses:**

This course is related to other communication courses offered by Electrical Engineering in that it introduces a new physical layer communication technology, not previously covered. It compliments existing courses on physical layer *Photonics* and *Wireless Communications*. This new course also compliments existing courses in *Quantum Devices* for quantum computers. Quantum communications will be very important in construction of distributed quantum computers. Finally, the course also compliments a new course in *Quantum Algorithms & Information* being introduced by Computing Science and Engineering.

#### **Graduate Attributes:**

This course will impact on the following graduate attributes

- 1. Development of skills involved in scholarly enquiry
- 2. Capacity for analytical and critical thinking and for creative problem-solving
- 3. The ability to engage in independent and reflective learning
- 4. Information literacy the skills to appropriately locate, evaluate and use relevant information
- 5. An appreciation of, and a responsiveness to, change

#### **Attendance at Lectures**

You are strongly encouraged to attend all class lectures. This is especially the case for this class as you will be presented with brand new concepts that you have likely never come across before. This makes the class very interesting for you – but it does require your participation in class. There will be no formal notes handed out that covers all the class material in detail, There will be power-points put on the class web site for download but these will not be sufficient for you to cover the class material. The lectures will consist of some power-point presentations, discussion of material in prescribed texts, and discussion of case studies. You are strongly encouraged to participate in class by interacting through questions and discussions of class material, and to prepare before class by reading relevant work packages ahead of time. There will be plenty of problem sets that will be reviewed in class. There may be guest lecturers.

# **Assessment Weighting**

- **Final Examination (65%):** The examination is of two-hour duration, covering all aspects of the course that have been presented in lectures. This exam will assess both understanding and analytical skills. You must pass this exam to pass course.
- Mid-Session Test (20%): The mid-session test will last about 45 minutes and will be held in week 6. It will cover material covered in the course in week 1 to 5, and will test your conceptual understanding of this material, as well as your ability to apply the concepts to solving problems. This is a compulsory test.
- Class Assignment (15%): Student groups (maximum three) will be charged with reviewing a research paper chosen from a list (to be given in class), or choosing a substantial simulation project which covers some aspects of the class work (this substantial simulation needs to be agreed to by me). This assignment is related to the learning outcome of being able to comprehend current research papers in the area. A formal 10 page report on the research paper or the simulation will be required by week 11. The assignment will be marked on the following criteria; Presentation (15%) depth of technical content (30%), independent critical thinking (40%). technical writing (15%). Students may do both a review of a paper and add some small Matlab simulation related to that paper (generally reviews that include a small Matlab simulation obtain higher marks). The students may present a powerpoint presentation on his/her report (although encouraged to do so the presentation is optional). The assignment will be due by end of week 11 – delivery will be electronic. Each member of the group should be prepared for oral examination by me on any part of the report. Individual marks may be given for the assignment.
- Tutorials: Each week you will likely be asked to hand in your answers to a short tutorial problem set. Some of the tutorial set may be given to you during the class and gathered from you during the same class. Your effort at these problem sets will form part of my own appraisal of how well you and the class are doing. These tutorials are not compulsory, will not be marked and do not form any part of the final class mark. However, they will be used to gauge your class participation and may be used when forming any judgement on possible bonus marks (see below). You are strongly encouraged to attempt these tutorials -if you do not you will likely struggle in this class. Solutions to tutorials will be discussed in class but no soft or hard copies of the solutions will be made available (this is to encourage your participation).
- Bonus Marks. A few bonus marks may be available for additional class participation – details in class. Note the combined bonus marks for any student will not exceed 5% of final class mark.
- Late reports and missed tests. There will be zero marks awarded for late reports, or missed tests.

# **Course Evaluation**

All students will be given the opportunity to provide feedback on the course. You are strongly encouraged to participate in this, especially as this course is relatively new.

Teaching staff take such feedback seriously and use it to improve the course delivery for the students who will follow you.

#### Consultations

Please make an appointment for consultation at other times beyond standard class consultations through e-mail to r.malaney@unsw.edu.au (all email must be from a UNSW student account). Normally, consultation time will be immediately after class.

# **Other Course Resources**

Please see class web site <a href="https://subjects.ee.unsw.edu.au/tele9757">https://subjects.ee.unsw.edu.au/tele9757</a> for other material (your personal "unipass" name and password will be needed to access this homepage). It is expected and assumed that you will check this web site at least once per week for important class announcements. Notes and lectures are available from the "download" link on class homepage (username: notes; password: ee&tview, will be needed for the download link.)

Plagiarism is strictly prohibited.
